PHP is a general-purpose scripting language geared towards web development. It was originally created by Danish-Canadian programmer Rasmus Lerdorf in 1993 and released in 1995. The PHP reference implementation is now produced by the PHP Group. PHP was originally an abbreviation of Personal Home Page, but it now stands for the recursive backronym PHP: Hypertext Preprocessor.

PHP code is usually processed on a web server by a PHP interpreter implemented as a module, a daemon or a Common Gateway Interface (CGI) executable. On a web server, the result of the interpreted and executed PHP code—which may be any type of data, such as generated HTML or binary image data—would form the whole or part of an HTTP response. Various web template systems, web content management systems, and web frameworks...

PHP Data Objects (PDO)

The PHP code consists of a core, with optional extensions to the core functionality. PHP's MySQL-related extensions, such as the MySQLi extension, and the MySQL extension, are implemented using the PHP extension framework. An extension typically exposes an API to the PHP developer, to allow its facilities to be used programmatically. However, some extensions which use the PHP extension framework do not expose an API to the PHP developer...

Bluefish is a free and open-source software and an advanced source code editor with a variety of tools for programming and website development. It supports editing source code such as C, JavaScript, Java, PHP, Python, and as well as markup languages such as HTML, YAML, and XML. It is available for many platforms, including Linux, macOS, and Windows, and can be used via integration with GNOME or run as a stand-alone application. Designed as a compromise between plain text editors and full programming IDEs, Bluefish is lightweight, fast and easy to learn, while providing many IDE features. Bluefish was one of the first source code editors on the Linux desktop. It has been translated into 17 languages. The source code is available under the GNU General Public License.

A "Hello, World!" program is usually a simple computer program that emits (or displays) to the screen (often the console) a message similar to "Hello, World!". A small piece of code in most general-purpose programming languages, this program is used to illustrate a language's basic syntax. Such a program is often the first written by a student of a new programming language, but it can also be used as a sanity check to ensure that the computer software intended to compile or run source code is correctly installed, and that its operator understands how to use it.

Microweber is an open-source content management system and website builder. It is based on the PHP programming language and the Laravel 5 web application framework, using drag and drop and allowing users to quickly create content, while scheduling and managing multiple displays. It has a Live Edit feature enabling users to view their edits as they would appear. The application has been used by several professional organisations according to rankings on OpenSourceCMS.com and Softaculous. Developers can freely access the code, exchanging their knowledge and contributions with the rest of the open-source community.

The site was launched in a beta version in April 2015 in Sofia, Bulgaria as a grass-roots project for an easy to use CMS system. The business has ranked as one of Bulgaria's Top 10...

An operating system abstraction layer (OSAL) provides an application programming interface (API) to an abstract operating system making it easier and quicker to develop code for multiple software or hardware platforms. It can make an application less dependent on any one specific operating system.

OS abstraction layers deal with presenting an abstraction of the common system functionality that is offered by any operating system by the means of providing meaningful and easy to use wrapper functions that in turn encapsulate the system functions offered by the OS to which the code needs porting. A well designed OSAL provides implementations of an API for several real-time operating systems (such as vxWorks, eCos, RTLinux, RTEMS). Implementations may also be provided for non real-time operating...
